

Veranda systems

The ideal roof system for the expansion of your home

ALUCOVER - VERATOP - VERAZUR

Design

The 3 insulated roof systems offer the same wide range of finishing options. You can choose from different gutter shapes (characterful, timeless, ...) and rectangular or molded girder profiles.

The roof systems can be combined with all Van Beveren window and door profiles. With regard to the finishing, attention has also been paid to the details: the drain can be stylishly concealed in the upright profile and atmospheric spotlights can be built into the profiles.

Veranda systems

The ideal roof system for the expansion of your home

ALUCOVER

Economical system with a variable inclination of up to 20°

The Alucover system is designed for economically responsible veranda roofs with thermal insulation without sacrificing structural strength or aesthetic design. Between 8 and 20°, any angle of inclination is possible.

VERATOP

The leading system for heavy glazing and a variable inclination of up to 25°

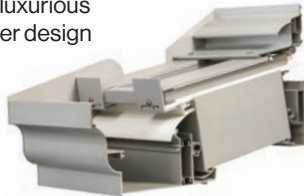

Veratop is a great system for the construction of a veranda with thermal insulation. The girder profiles have been adjusted for the installation of double glazing or for roof panels with a thickness of up to 44 mm.

VERAZUR

Luxurious and fine finishing with a variable inclination of up to 40°

The Verazur system is the most luxurious system and offers an even greater design freedom due to its variable inclination of up to 40°.

PROPERTIES OF THE VERANDA SYSTEMS

	ALUCOVER	VERATOP	VERAZUR
Insulation	System insulated by means of PVC profiles and fibreglass-reinforced polyamide strips		
Inclination	8° to 20°	7,5° to 25°	7,5° to 40°
Glazing	Up to 32 mm	Up to 44 mm	Up to 44 mm
Roof girders	Rectangular girders of 59, 92 or 112 mm, or molded girders of 112 mm		
Joinery adjustment	All Van Beveren systems		
Drain	Concealed built-in drain possible		
Gutter	Flat, characterful or with different elevation profiles
